1. Introduction

This document is intended to provide detailed instructions for processing non-sterile devices manufactured by the Spine division. All non-sterile devices must be cleaned and sterilized to prepare them for use. This document also gives instructions for inspection to determine when an instrument has reached the end of its serviceable life and must be replaced.

This document provides assembly and disassembly instructions for multi-component instruments which must be disassembled prior to cleaning and/or sterilization.

Stryker has validated the processes provided in these instructions to be capable of being effective. Equipment, operators, cleaning agents, and procedures all contribute to the efficacy of the processing. The healthcare facility should ensure that the selected processing steps are safe and effective.

Alternative methods of processing outside the scope of this document may be suitable for reprocessing; however, these must be validated by the end user.

In accordance with ISO 17664, two methods of cleaning the Spine division's non-sterile devices are provided in these instructions, a fully-manual method (Section 4) and a method using an automated washer-disinfector (Section 5). Whenever possible the automated method should be used. The automated cleaning process is more reproducible and, therefore, more reliable. Additionally, staff are less exposed to the contaminated devices and the cleaning agents used.

Whichever method is used, staff should use suitable protective clothing and equipment at all times. In particular, take note of the instructions provided by the cleaning agent manufacturer for correct handling and use of the product.

Warnings and precautions

Single use devices must not be reused, as they are not designed to perform as intended after the initial use, unless they are reprocessed by a reprocessor expressly authorized by Stryker. Only then can it be assured that the device is appropriate for reprocessing and that the correct methods of validation are used. Please refer to the device label to identify single or multiple use devices and components.

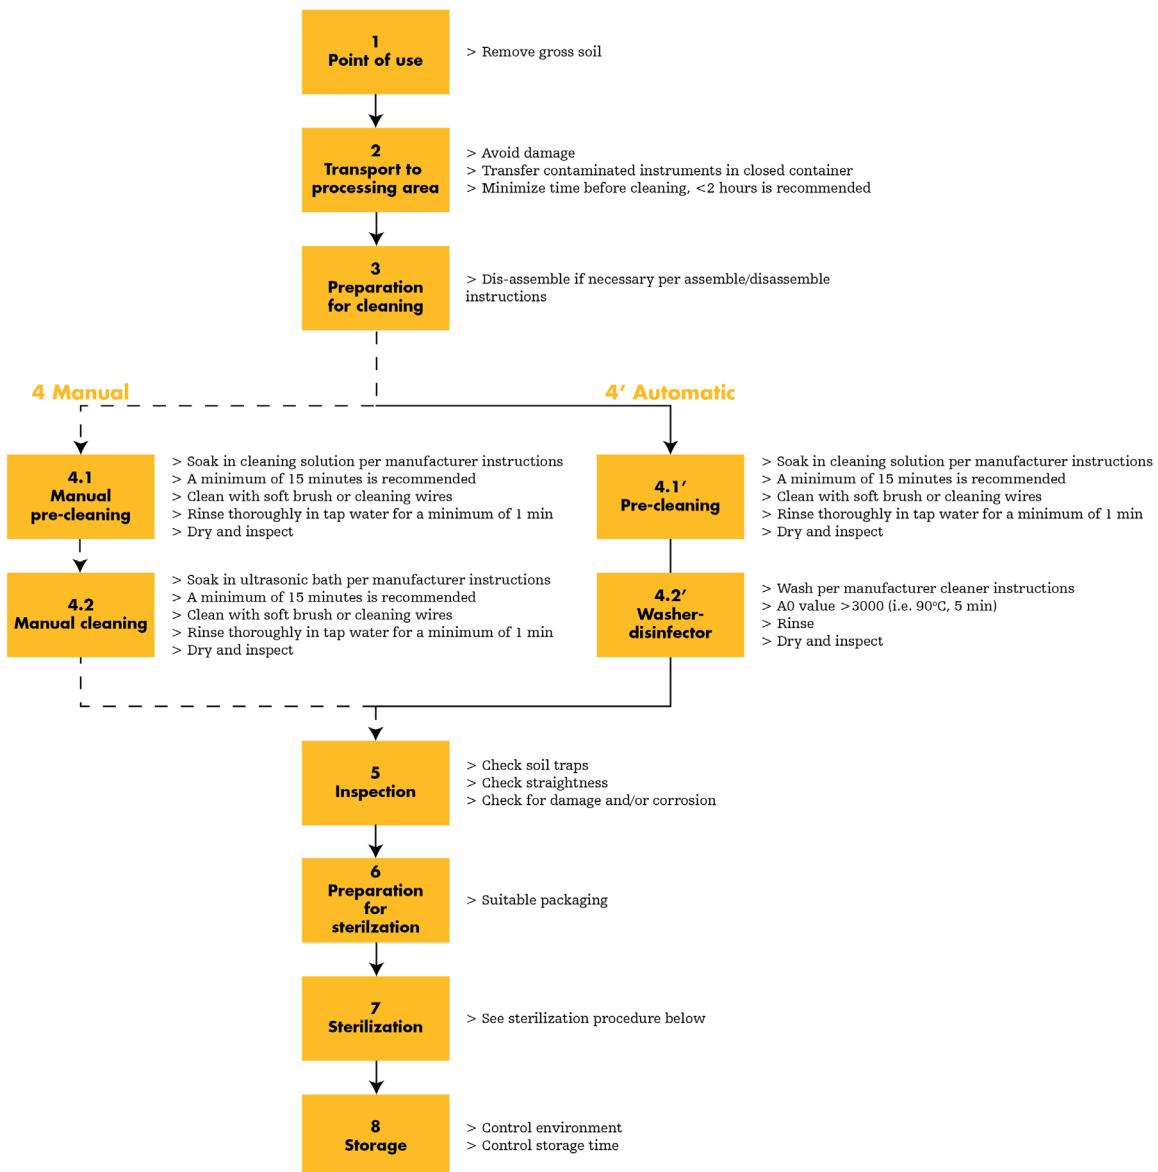

Some device materials may develop changes in mechanical, physical, or chemical characteristics under conditions of repeated use, cleaning and re-sterilization that may compromise the integrity of the design and/or material leading to diminished safety, performance, and/or compliance with relevant specifications.

The Spine division's non-sterile devices are not normally used in surgical procedures where they contact TSE infective tissue (Transmissible Spongiform Encephalopathies) as defined by the World Health Organization (WHO). Therefore decontamination procedures with highly aggressive agents [i.e. sodium hydroxide (NaOH) or sodium hypochlorite (NaClO)] are not necessary and, for normal processing, are not recommended because material degradation may occur. The sterilization parameters recommended in this document are not intended and not suitable for inactivation of prions.

2. Reprocessing overview

The sequence of steps required to prepare non-sterile instruments for use are summarized in the chart below. More detailed instructions for each step are given on the following pages.

Note: Cleaning and sterilization is required for initial use of devices.

Note:

The quality of the water used for diluting cleaning agents and/or disinfectants and for rinsing non-sterile instruments should be carefully considered.

Application of freshly prepared purified water/highly purified water or sterile water for rinsing purposes with less than 100 CFU/ml and 0.5 EU/ml is highly recommended.

Mineral residues from hard water, as well as higher contamination with microorganisms and endotoxins, can result in staining of the device or prevent effective cleaning and sterilization.

3. Preparation for cleaning

(Point-of-use for all instruments)

Point of use

After use (within a maximum of 2 hours post-operatively) remove gross soil using absorbent paper wipes. Intensive rinsing of the reusable device with fluent water or transfer of the medical devices into a bath with an aldehyde-free disinfectant solution is highly recommended.

Transport to processing area

Avoid mechanical damage by ensuring that heavy devices do not get mixed with delicate ones. Pay particular attention to sharp edges, both to avoid personal injury and prevent damage to the reusable devices. Transport the reusable devices to the point where cleaning is to be performed as soon as practical. If transfer to the processing area is likely to be delayed, consider covering the instruments with a damp cloth to avoid drying of soil.

Preparation for cleaning

Appendix 1 provides specific instructions for instruments that require disassembly prior to cleaning.

Caution:

Stryker's trays and cases are intended for transport and storage of re-usable instruments. They are not designed for cleaning and/or disinfection in the fully assembled state. The instruments must be removed from the tray for adequate cleaning results.

4. Manual cleaning

Pre-cleaning

Remove gross soil using wipes and solution of cleaning agent.

Immerse non-sterile device in solution of cleaning agent.

Ensure that all surfaces are thoroughly wetted. Use a syringe or pipette to ensure that the cleaning solution reaches all parts of cannulations.

Ensure that air is not trapped within features of the device when immersing in the solution.

Soak for minimum of 15 minutes.

Using suitable soft and/or firm bristle brushes, clean the non-sterile device thoroughly, paying particular attention to rough surfaces, threaded areas, and features where soil may be impacted or shielded from the cleaning process.

Use a bottle brush of appropriate diameter and length for cannulations.

Ensure that the brush passes the whole length of each cannulation.

Operate articulating devices and those with moving parts.

Rinse in running water until all traces of cleaning solution are removed.

Pay particular attention to cannulations and blind holes, as well as hinges and joints, between mating parts.

Visually inspect for any remaining soil and repeat the steps above if necessary.

Allow to drain on absorbent paper or transfer immediately to cleaning step.

Caution:

Never use metal brushes or steel wool for cleaning.

4. Manual cleaning

Cleaning

Equipment required:

- Ultrasonic bath large enough to allow complete immersion of the device. A frequency of 25 – 50 kHz is recommended. Do not exceed the temperature range stated by the detergent manufacturer.
- Cleaning agent intended for manual cleaning and suitable for ultrasonic treatment. Do not exceed the concentration specified by the detergent manufacturer.
- Suitable brushes or cleaning wires to reach all parts of the device.
Caution: Never use metal brushes or steel wool for cleaning.
- Syringes (volumes 1 to 50 mL, depending on the size of the channels to be rinsed)
- Fresh purified water, highly purified water, or sterile water for rinsing purposes.

Instructions:

Prepare an ultrasonic bath with a cleaning solution at the concentration and temperature specified by the detergent manufacturer.

Immerse the device completely and activate the bath for minimum of 15 minutes.

Using suitable brushes or cleaning wires, clean the device paying particular attention to rough surfaces, threaded areas, and features that may be shielded from the brushing action.

Rinse for at least 1 minute in running water until all traces of cleaning solution are removed. Pay particular attention to cannulations, blind holes, hinges, and joints between mating parts.

If, after completion of the cleaning step in the ultrasonic bath, encrusted soil remains on the device, the cleaning step must be repeated as described above.

Note:

The guidance provided by the cleaning agent manufacturer concerning concentrations and temperatures should be followed. If these concentrations and temperatures are exceeded significantly, discoloration or corrosion could occur with some materials. This could also happen if rinsing after cleaning and/or disinfecting is insufficient.

For cleaning non-sterile devices, only specifically formulated cleaning agents should be used.

As not all cleaning agents may be available around the globe, Stryker does not recommend any specific cleaning agent. The end user should verify the selected cleaning agent is appropriate for use on surgical devices designed for reprocessing.

5. Automated cleaning and disinfection

Equipment required:

- Washer-disinfector with demonstrated efficiency (e.g. CE mark or FDA clearance and validated in accordance to ISO 15883), properly installed, qualified, and regularly subjected to maintenance and testing.
- Approved thermal rinse/disinfection program (application of at least 5 minutes at 90°C).
- Cleaning agent intended for use in washer-disinfector. Do not exceed the concentration and temperature recommended by the detergent manufacturer.

Instructions:

Load the devices into the washer-disinfector per required loading configuration.

Connect cannulations to the rinsing ports of the washer-disinfector. If no direct connection is possible, locate the cannulations directly on injector jets or in injector sleeves of the injector basket.

Avoid contact between devices as movement during washing could cause damage, and washing action could be obstructed.

Arrange devices so that cannulations are not horizontal, and blind holes incline downwards to assist with cleaning and drainage.

Articulating devices should be in the open position.

Operate the washer-disinfector cycle.

Upon completion, unload the washer-disinfector. Visually inspect each device for remaining soil and dryness. If soil remains, repeat the cleaning process.

Remaining wetness may be removed with filtered, compressed air or clean, lint-free wipes.

If additional drying is required, arrange instruments in a clean area or heat in an oven below 110°C.

Caution:

Chemical disinfection programs are not recommended due to the potential for chemical residues to remain on the instruments. These residues could interfere with sterilization efficacy.

Caution:

The parameters identified in this document are the minimum for effective cleaning and sterilization of our instruments. Use of high pH cleaning solutions will reduce the life of instruments. Stryker recommends using a pH neutralizer to limit damage to instruments, as exposure to high pH is known to strip protective coatings from metals, especially aluminum.

6. Inspection

Before preparing for sterilization, all devices should be inspected.

Generally un-magnified visual inspection under good light conditions is sufficient.

All parts of the devices should be checked for visible soil and/or corrosion.

Particular attention should be paid to:

- Soil “traps” such as mating surfaces, hinges, threaded areas, and flexible shafts.
- Recessed features (holes, cannulations, and textured surfaces).
- Features where soil may be impacted into the device, such as taps, drills, rongeurs.
- Cutting edges should be checked for sharpness and damage.

Mating devices should be checked for proper assembly. Instruments with moving parts should be operated to check correct operation; application of medical grade lubricants that are biocompatible per ISO 10993 may be necessary.

“Flexible” instruments should be checked for damage to the spiral element.

Note:

The life of the instrument depends on the number of times they are used as well as the precautions taken in handling, cleaning, and storage. Great care must be taken of the instruments to ensure that they remain in good working order.

Instruments should be examined for wear or damage by physicians and staff in operating centers prior to surgery.

The examination shall include a visual and functional inspection of the working surfaces, articulation points, rotating features, hinges, springs, connection mechanisms, mating parts, cutting features, threads, and working tip of all instruments.

7. Packaging

Preparation for sterilization

Commercially available sterilization wrap:

Stryker's tray configurations should be double wrapped according to AAMI/CSR technique.

The packaging for terminally sterilized devices should be suitable for steam sterilization and the appropriate grade for the weight of the devices. Additionally, the wrap should be compliant to the following requirements:

- AAMI ST79
- ISO 11607
- CE mark
- FDA 510(k) clearance for specified sterilization parameters

Rigid container:

Stryker has validated steam sterilization of complete device trays with Aesculap SterilContainer System.

For a complete list of rigid container compatibility details, reference Appendix 2.

For all sterilization packaging configurations, Stryker recommends the use of biological indicators as described in ISO 11138-3 (*Geobacillus stearothermophilus*) and/or chemical indicators as described in ISO 11140 for proper monitoring of all sterilization cycles.

Caution:

Stryker has only validated the specific lid/case combinations listed to the parameters listed in Section 8. While other combinations and parameters may be appropriate, the responsibility for validation and evaluation would be on the end-user.

Warning:

The use of lid/ case/tray combinations in a rigid container system that has not been properly validated in accordance with ISO 17665 may result in the inability to meet the required sterility assurance level (SAL) of 10^{-6} .

Note: Instruments *may* be individually wrapped and sterilized.

Specialty devices must be individually wrapped and sterilized.

8. Sterilization

The sterilization parameters shown at the right are validated at minimum time and temperature in accordance with ANSI/AAMI ST79 and EN ISO 17665. Steam autoclave (moist heat) sterilization using a pre-vacuum (forced air removal) cycle is recommended. Autoclaves should comply with the requirements of, and be validated and maintained in accordance with, EN 285, EN 13060, EN ISO 17665, and ANSI/ AAMI ST79.

Stryker has validated the recommended sterilization cycle for complete non-sterile device cases/trays.

Compatibility with rigid container systems is provided in Appendix 2. Rigid Container Steam Sterilization Instructions for outside USA are provided in Appendix 3.

USA

Method	Moist heat sterilization according to ANSI/AAMI ST79 and EN ISO 17665
Cycle	Pre-vacuum (dynamic air removal)
Temperature	132°C (270°F)
Exposure time ¹	4 minutes
Drying time ²	45 minutes (minimum, in chamber)

Outside USA

Method	Moist heat sterilization according to EN ISO 17665
Cycle	Pre-vacuum (dynamic air removal)
Temperature	134°C (273°F)
Exposure time ¹	3 minutes (minimum)
Drying time ²	45 minutes (minimum, in chamber)

Caution:

These parameters may differ in the instructions for use for some of our systems. However, both parameters have been validated.

- **Exceptions:** Stryker's AVS ARIA System and AVS AL PEEK Spacer System **must not** be sterilized using reusable, rigid sterilization containers. These systems shall be sterilized according to the [Steam Sterilization with FDA-Cleared/Commercially Available Sterilization Wrap Instructions](#).

Caution:

Stryker does not recommend the use of 'flash' sterilization for non-sterile devices.

Caution:

Longer cycles, such as those recommended for control or elimination of Transmissible Spongiform Encephalopathies, may be utilized; however, instruments should be expected to have reduced functional life.

Warning:

Implants and instruments which are supplied sterile must not be re-sterilized as this process has not been validated.

¹ Exposure time:

Period for which the load and entire chamber is maintained at the sterilization temperature.

² Drying time:

Period during which steam is removed from the chamber and the chamber pressure is reduced to permit the evaporation of condensate from the load either by prolonged evacuation or by the injection and extraction of hot air or other gases. The drying time varies due to load configuration, wrapping method, and material. Therefore, dry time may be repeated if moisture is present on the wrap and/or instruments.

9. Storage before use

After sterilization, devices should be stored in the sterilization wrap or rigid container in a dry and dust-free place. The shelf life is dependent on the sterile barrier employed, storage manner, environmental conditions, and handling.

A maximum shelf life for sterilized devices should be defined by each health care facility based on the recommendations of the wrap or container manufacturer.

			5	Use pressure gauge knob to rotate pressure gauge counter clockwise until it loosens and can be pulled out
			6	Remove o-ring from pressure gauge and discard
			7	Remove tube set from inserter and discard

Appendix 2:

Rigid container compatibility for device sets

Stryker has validated steam sterilization of complete, fully loaded non-sterile device trays with Aesculap's SterilContainer System. Other rigid container systems may be suitable for use, but must be evaluated by the end-user.

Refer to Aesculap Instructions for Use for Care & Handling of Aesculap SterilContainer Systems.

- **Exceptions:** Stryker's AVS ARIA System and AVS AL PEEK Spacer System **must not** be sterilized using reusable, rigid sterilization containers. These systems shall be sterilized according to the **Steam Sterilization with FDA-Cleared/Commercially Available Sterilization Wrap Instructions**

Appendix 3:

Rigid container steam sterilization instructions

In order to ensure proper sterilization of the Spine division's devices when using the Aesculap SterilContainer (JN series) reusable, rigid sterilization containers, the information below must be followed:

1. Only the following Aesculap reusable rigid container configuration, FDA-cleared, shall be used in a pre-vacuum steam sterilization cycle for use in the USA:

Name	Part Number	Description
Container base	JN442	Full size, 6-inch height, perforated bottom
Lid	JK489	Full size, 2000 lid, aluminum
Filter	US994	7½ inches round, single use

2. Only the following Aesculap reusable rigid container configuration shall be used in a pre-vacuum steam sterilization cycle for use outside the USA:

Name	Part Number	Description
Container base	JN442	Full size, 6-inch height, perforated bottom
Lid	JK489	Full size, 2000 lid, aluminum
Filter	JK095	Round filter paper with process indicator, CE marked

3. Aesculap SterilContainer instructions for use must be followed. If questions arise regarding the use of the Aesculap SterilContainer reusable, rigid sterilization container, Stryker recommends contacting Aesculap directly for guidance.

Appendix 3:

Rigid container steam sterilization instructions

4. Sterilization instructions:

- a. No more than two (2) individual Spine Tray inserts can be placed directly into the Aesculap SterilContainer (JN Series) reusable, rigid sterilization container (perforated bottom).
- b. Stryker's Spinal devices must be placed in their designated locations within the tray inserts.

The Spine division's single devices or modules/caddies/racks may be placed into an Aesculap basket (JC 223R or similar) which can be loaded into the Aesculap SterilContainer reusable, rigid sterilization containers.

Note: Devices must be placed such that individual devices are not stacked and remain in an open position to allow uniform exposure to steam.

- c. Spine Container lids must be removed prior to use with the Aesculap reusable, rigid sterilization container.
- d. Spine devices were validated under the following USA sterilization parameters for a pre-vacuum, three pulse steam cycle:

- **Temperature:** 132°C (270°F)
- **Exposure time:** 4 minutes
- **Cycle dry time:** 30 minutes

- e. Spine devices were validated under the following outside the USA sterilization parameters for pre-vacuum, three pulse steam cycle:

- **Temperature:** 134°C (273°F)
- **Exposure time:** 3 minutes
- **Cycle dry time:** 30 minutes

- f. Reusable rigid sterilization containers must not be stacked within the autoclave as doing so may negatively impact ventilation and sterilization.

Appendix 4:

OUS Parameters for sterilization wrap compatibility for Xia 3 sets

Stryker has conducted validation testing for compatibility of the Xia 3 sets noted below for OUS Parameters (134°C for a minimum 3 minutes).

Below are instructions for Xia 3 sets which contain the French Bender.

Name	Description
Xia 3 Degenerative Instrument Tray	48230012B (Base tray) The French Bender (Part Number 48237010) must be removed from the tray and sterilized separately using a commercially available sterilization wrap.

Name	Description
Xia 3 Rods and Cross Connectors Box	48230006 (Base tray) The French Bender (Part number 48237010) must be removed from the tray and sterilized separately using a commercially available sterilization wrap.

Appendix 5:

Extended dry time table

The following configurations require an extended minimum dry time when double wrapped for steam sterilization only:

Description	Reference	Minimum dry time
Xia Titanium Screw Tray	48040004	60 minutes
Xia Stainless Steel Screw Box	48040001	60 minutes
Xia Titanium Hook Tray	48040006	60 minutes
Xia Stainless Steel Hook Tray	48040007	60 minutes
Xia Common	48040005	105 minutes
MAC Tray	4801-0000	105 minutes
MAC Stainless Steel Tray	48040003	105 minutes
AVS PL PEEK Container:	48350000	105 minutes
